*See *SI Appendix 2* for more details about the tipping elements that failed to make the short list.
†Numbers given are preliminary and derive from assessments by the experts at the workshop, aggregation of their opinions at the workshop, and review of the literature.
‡Global mean temperature change above present (1980–1999) that corresponds to critical value of control, where this can be meaningfully related to global temperature.
§Meaning theory, model results, or paleo-data suggest the existence of a critical threshold but a numerical value is lacking in the literature.
¶Meaning either a corresponding global warming range is not established or global warming is not the only or the dominant forcing.
‖Meaning no subcontinental scale critical threshold could be identified, even though a local geographical threshold may exist.
